### **TCP (Transmission Control Protocol)**

- TCP is a connection oriented layer 4 protocol (transport layer) and is transmitted inside the IP data field
- Provides a secure end-to-end transport of data between computer processes of different end systems
- Secure transport means:
  - Error detection and recovery
  - Maintaining the order of the data without duplication or loss

Internet Transport Layer, v4

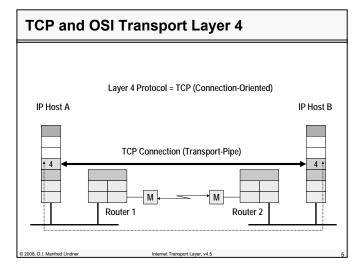

- Flow control
- RFC 793

© 2008, D.I. Manfred Lindner

© 2008, D.I. Manfred Lindner

Page 11 - 1

L11 - Internet Transport Layer (TCP, UDP)

### TCP Protocol Functions

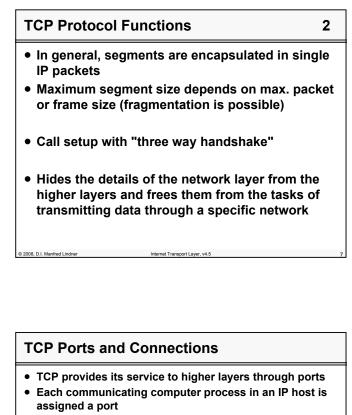

- Data transmission within segments
- ARQ protocol with Continuous Repeat Request technique and piggy-backed acknowledgments

1

- Error recovery through sequence numbers (based on octets !), positive & multiple acknowledgements and timeouts for each segment
- Flow control with sliding window and dynamically adjusted window size

2008, D.I. Manfred Lindner

### L11 - Internet Transport Layer (TCP, UDP)

- identified by a port number
- By usage of ports the TCP software can serve multiple processes (browser, e-mail etc.) simultaneously
- The TCP software functions like a multiplexer and demultiplexer for TCP connections
  - Port 25 on system A:
    - process 1, system A <----> process 3, system B
  - Port 53 on system A:
  - process 2, system A <----> proc. 9, system C

- (see next slide)

Internet Transport Layer, v4

L11 - Internet Transport Layer (TCP, UDP)

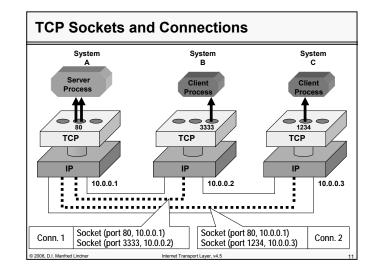

### **TCP Sockets and Connections**

- In a client-server environment a communicating server-process has to maintain several sessions (and also connections) to different targets at the same time
- Therefore, a single port has to multiplex several virtual connections
  - these connections are distinguished through sockets
- The combination IP address and port number is called a "socket"
  - Each socket pair uniquely identifies a connection

© 2008, D.I. Manfred Lindner

### L11 - Internet Transport Layer (TCP, UDP)

### **TCP Well Known Ports**

### Well known ports

- Are reserved for common applications and services (like Telnet, WWW, FTP etc.) and are in the range from 0 to 1023
- Are controlled by IANA (Internet Assigned Numbers Authority)
- Registered ports
  - start at 1024 (e.g. Lotus Notes, Cisco XOT, Oracle, license managers etc.). They are not controlled by the IANA (only listed, see RFC1700)
- Well-known ports together with the socket concept allow several simultaneous connections (even from a single machine) to a specific server application
- Server applications listen on their well-known ports for incoming connections
- · Port concept und port numbers also used for UDP

© 2008, D.I. Manfred Lindner Internet Transport Layer, v4.5

© 2008, D.I. Manfred Lindner

- Client applications chose a free port number (which is not already used by another connection) as the source port
- The destination port is the well-known port of the server application
- Some services like FTP or Remote Procedure Call use dynamically assigned port numbers:
  - Sun RPC (Remote Procedure Call) uses a portmapper located at port 111...

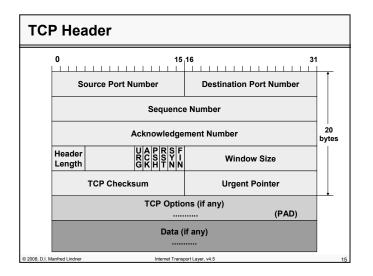

Internet Transport Layer, v4.5

- FTP uses the PORT and PASV commands...
- ...to switch to a non-standard port

Som	e Well Known Ports		
7	Echo	Some	Registered Ports
20	FTP (Data), File Transfer Protocol	1416	Novell LU6.2
21	FTP (Control)	1433	Microsoft-SQL-Server
23 25	TELNET, Terminal Emulation SMTP, Simple Mail Transfer Protocol	1439	Eicon X25/SNA Gateway
53	DNS, Domain Name Server	1527	oracle
69	TFTP, Trivial File Transfer Protocol	1986 1998	cisco license managm cisco X 25 service
80	HTTP Hypertext Transfer Protocol	1998	(XOT)
111 137	Sun Remote Procedure Call (RPC) NetBIOS Name Service	5060	SIP (VoIP Signaling)
138	NetBIOS Datagram Service	6000	١
139	NetBIOS Session Service		> X Window System
161	SNMP, Simple Network Management Protocol	6063	I

### L11 - Internet Transport Layer (TCP, UDP)

TCP Header Er	ntries
Source and De	estination Port
<ul> <li>Port number for</li> </ul>	r source and destination process
Header Length	l
<ul> <li>Indicates the le bit words (4 oct</li> </ul>	ngth of the header given as a multiple of 32 tets)
<ul> <li>necessary, bec</li> </ul>	ause of the variable header length
Sequence Nun	nber (32 Bit)
<ul> <li>Position of the</li> </ul>	first octet of this segment within the data around" to 0 after reaching 2^32 -1)
Acknowledge	Number (32 Bit)
	the correct reception of all octets up to ack- 1 and indicates the number of the next by the receiver
© 2008, D.I. Manfred Lindner	Internet Transport Layer, v4.5

### **TCP Header Entries**

### • Flags: SYN, ACK

- SYN: If set, the Sequence Number holds the initial value for a new session
  - SYN is used only during the connect phase (can be used to recognize who is the caller during a connection setup e.g. for firewall filtering)
- Used for call setup (connect request)
- ACK: If set, the Acknowledge Number is valid and indicates the sequence number of the next octet expected by the receiver

Internet Transport Laver v4.5

### **TCP Header Entries**

### • Flags: FIN, RST

2008 D I Manfred Lindner

- FIN: If set, the Sequence Number holds the number of the last transmitted octet of this session
  - using this number a receiver can tell that all data have been received; FIN is used only during the disconnect phase
- Used for call release (disconnect)
- RST: If set, the session has to be cleared immediately
   Can be used to refuse a connection-attempt or to "kill" a current connection.

Internet Transport Layer, v4.

2008, D.I. Manfred Lindner

### L11 - Internet Transport Layer (TCP, UDP)

### **TCP Header Entries**

### • Window (16 Bit)

- Set by the source with every transmitted segment to signal the current window size; this "dynamic windowing" enables receiver-based flow control
- The value defines how many additional octets will be accepted, starting from the current acknowledgment number
- SeqNr of last octet allowed to sent: AckNr plus window value
- Remarks:

© 2008 D I Manfred Lindner

- Once a given range for sending data was given by a received window value, it is not possible to shrink the window size to such a value which gets in conflict with the already granted range
- so the window field must be adapted accordingly in order to achieve the flow control mechanism STOP

Internet Transport Layer, v4.5

### **TCP Header Entries**

### • Checksum

- The checksum includes the TCP header and data area plus a 12 byte pseudo IP header
  - (one's complement of the sum of all one's complements of all 16 bit words)
- The pseudo IP header contains the source and destination IP address, the IP protocol type and IP segment length (total length). This guarantees, that not only the port but the complete socket is included in the checksum
- Including the pseudo IP header in the checksum allows the TCP layer to detect errors, which can't be recognized by IP (e.g. IP transmits an error-free TCP segment to the wrong IP end system)

© 2008, D.I. Manfred Lindner

© 2008, D.I. Manfred Lindner Page 11 - 9 © 2008, D.I. Manfred Lindner

Internet Transport Layer, v4

### • Flags: URG

- Is used to indicate important "urgent" data
- If set, the 16-bit "Urgent Pointer" field is valid and points to the <u>last</u> octet of urgent data
  - sequence number of last urgent octet = actual segment sequence number + urgent pointer
  - RFC 793 and several implementations assume the urgent pointer to point to the first octet *after* the urgent data; However, the "Host Requirements" RFC 1122 states this as a mistake!
  - Note: There is no way to indicate the beginning of urgent data (!)
- When a TCP receives a segment with the URG flag set, it notifies the application which switch into the "urgent mode" until the last octet of urgent data is reached
- Examples for use: Interrupt key in Telnet, Rlogin, or FTP

Internet Transport Layer, v4.5

### **TCP Header Entries**

### • Urgent Pointer

- points to the last octet of urgent data
- Options

2008 D L Manfred Lindner

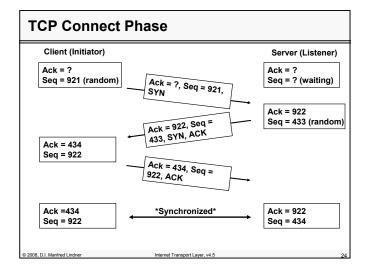

- Only MSS (Maximum Segment Size) is used frequently Other options are defined in RFC1146, RFC1323 and RFC1693
- Pad

© 2008, D.I. Manfred Lindner

 Is used to make the header length an integral number of 32 bits (4 octets) because of the variable length options

### L11 - Internet Transport Layer (TCP, UDP)

### **TCP Header Entries 9.** Flags: PSH **1** "PUSH": If set, the segment should be forwarded to the next layer immediately without buffering. A TCP instance can decide on its own, when to send data to the next instance. One strategy could be, to collect data in a buffer and pupication which needs a low latency or a constant data stream sublike to bypass this buffer with the PSH flag. Also the last segment of a request could use the PSH flag. **1** Today often ignored

© 2008, D.I. Manfred Lindner

Internet Transport Layer, v4

Page 11 - 11

© 2008, D.I. Manfred Lindner

L11 - Internet Transport Layer (TCP, UDP)

### L11 - Internet Transport Layer (TCP, UDP)

### **TCP Connect Phase**

- TCP uses the unreliable service of IP, hence TCP segments of old sessions (e.g. retransmitted or delayed segments) could disturb a TCP connect
- Random starting sequence numbers and an explicit negotiation of starting sequence numbers makes a TCP connect immune against spurious packets
- Disturbing Segments (e.g. delayed TCP segments from old sessions etc.) and old "halfopen" connections are deleted with the RST flag

Internet Transport Laver v4

• --> "Three Way Handshake"

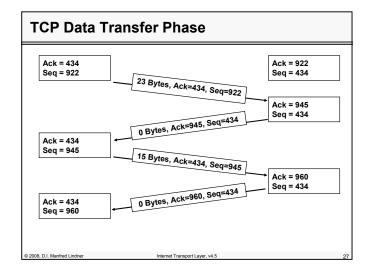

2008 D I Manfred Lindner

2008, D.I. Manfred Lindner

### **TCP Duplicates after Connect**

- Duplicates of old TCP sessions (same source/destination IP address and TCP socket) can disturb a new session
- Thus sequence numbers must be unique for different sessions of the same socket.
- Initial sequence number (ISN) must be chosen with a good algorithm
- RFC793 suggests to pick a random number at boot time (e.g. derived from system start up time) and increment every 4 µs. Every new connection will increment additionally by 1

Internet Transport Layer,

### TCP Data Transfer Phase

2008 D I Manfred Lindner

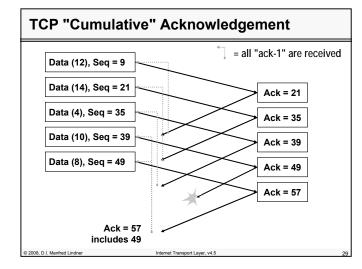

- Acknowledgements are generated for all octets which arrived in sequence without errors (positive acknowledgement)
  - Note: duplicates are also acknowledged
  - If a segment arrives out of sequence, no acknowledges are sent until this "gap" is closed
- The acknowledge number is equal to the sequence number of the next octet to be received
  - Acknowledges are "cumulative": Ack(N) confirms all octets with sequence numbers up to N-1
  - Thus, lost acknowledgements are not critical since the following ack confirms all previous segments Internet Transport Laver v4 5

© 2008. D.I. Manfred Lindner

Page 11 - 13

© 2008, D.I. Manfred Lindner

L11 - Internet Transport Layer (TCP, UDP)

### **TCP** Timeout

- Timeout will initiate a retransmission of unacknowledged data
- Value of retransmission timeout influences performance (timeout should be in relation to round trip delay)
  - High timeout results in long idle times if an error occurs
  - Low timeout results in unnecessary retransmissions

### • Adaptive timeout

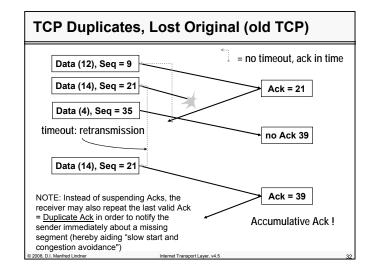

- KARN algorithm uses a backoff method to adapt to the actual round trip delay

2008, D.I. Manfred Lindner Internet Transport Layer, v4. Datenkommunikation 384.081 - SS 2008

### L11 - Internet Transport Layer (TCP, UDP)

### **TCP** Duplicates Reasons for retransmission: - Because original segment was lost: No problem, retransmitted segment fills gap, no duplicate - Because ACK was lost or retransmit timeout expired: No problem, segment is recognized as duplicate through the sequence number - Because original was delayed and timeout expired: No problem, segment is recognized as duplicate through the sequence number 32 bit sequence numbers provide enough "space" to differentiate duplicates from originals - 2<sup>32</sup> Octets with 2 Mbit/s means 9h for wrap around (compare to usual TTL = 64 seconds) © 2008 D I Manfred Lindner

Datenkommunikation 384.081 - SS 2008

L11 - Internet Transport Layer (TCP, UDP)

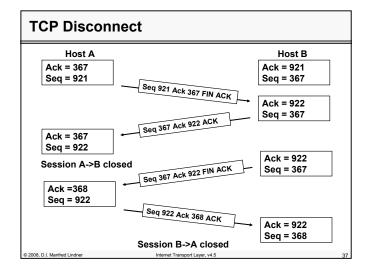

# TCP Disconnect A TCP session is disconnected similar to the three way handshake The FIN flag marks the sequence number to be the last one; the other station acknowledges and terminates the connection in this direction The exchange of FIN and ACK flags ensures, that both parties have received all octets The RST flag can be used if an error occurs during the disconnect phase

© 2008, D.I. Manfred Lindner

Page 11 - 17

### L11 - Internet Transport Layer (TCP, UDP)

### Flow control: "Sliding Window"

- TCP flow control is done with dynamic windowing using the sliding window protocol
- The receiver advertises the current amount of octets it is able to receive
  - using the window field of the TCP header
  - values 0 through 65535

2008, D.I. Manfred Lindner

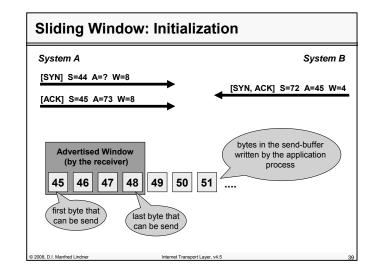

- Sequence number of the last octet a sender may send = received ack-number -1 + window size
  - The starting size of the window is negotiated during the connect phase
  - The receiving process can influence the advertised window, hereby affecting the TCP performance

Page 11 - 21

L11 - Internet Transport Layer (TCP, UDP)

### **Sliding Window**

- The right edge of the window must not move leftward !
  - however, TCP must be able to cope with a peer doing this
     called *shrinking* window
- The left edge cannot move leftward because it is determined by the acknowledgement number of the receiver
  - only a duplicate Ack would imply to move the left edge leftwards, but duplicate Acks are discarded

Internet Transport Laver v4 5

### **TCP Enhancements**

- So far, only basic TCP procedures have been mentioned
- TCP's development still continues; it has been already enhanced with additional functions which are essential for operation of TCP sessions in today's IP networks:
  - Slow Start and Congestion Avoidance Mechanism
  - Fast Retransmit and Fast Recovery Mechanism
  - Delayed Acknowledgements
  - The Nagle Algorithm

- ....

2008 D I Manfred Lindner

2008, D.I. Manfred Lindner

L11 - Internet Transport Layer (TCP, UDP)

### **TCP Enhancements Overview** 1 • Slow Start and Congestion Avoidance Mechanism: • • controls the rate of packets which are put into a network (sender-controlled flow control as add on to the receivercontrolled flow control based on the window field) • Fast Retransmit and Fast Recovery Mechanism: • to avoid waiting for the timeout in case of retransmission and to avoid slow start after a fast retransmission

### **TCP Enhancements Overview** 2 Immediate acknowledgements may cause an unnecessary amount of data transmissions - normally, an acknowledgement would be send immediately after the receiving of data - but in interactive applications, the send-buffer at the receiver side gets filled by the application soon after an acknowledgement has been send (e.g. Telnet echoes) In order to support piggy-backed acknowledgements (i.e. acks combined with user data), the TCP stack waits 200 ms before sending the delayed acknowledgement - during this time, the application might also have data to send © 2008, D.I. Manfred Lindner Internet Transport Layer, v4

© 2008, D.I. Manfred Lindner

Internet Transport Laye

Page 11 - 23

© 2008, D.I. Manfred Lindner

### segments - "tinygrams"

 e.g. Telnet or Rlogin where each key-press generates 41 bytes to be transmitted: 20 bytes IP header, 20 bytes TCP header and only 1 byte of data (!)

3

- Frequent tinygrams can lead to congestion at slow WAN connections
- Nagle Algorithm:
  - When a TCP connection waits for an acknowledgement, small segments must not be sent until the acknowledgement arrives
  - In the meanwhile, TCP can collect small amounts of application data and send them in a single segment when the acknowledgement arrives

Internet Transport Laver v4

### UDP (User Datagram Protocol, RFC 768)

- UDP is a connectionless layer 4 service (datagram service)
- Layer 3 Functions are extended by port addressing and a checksum to ensure integrity
- UDP uses the same port numbers as TCP (if applicable)
- Less complex than TCP, easier to implement

© 2008, D.I. Manfred Lindner

### © 2008, D.I. Manfred Lindner

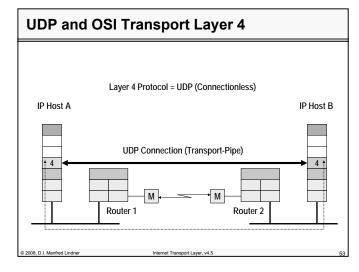

Internet Transport Laye

Page 11 - 25

© 2008, D.I. Manfred Lindner

Internet Transport Layer, v

L11 - Internet Transport Layer (TCP, UDP)

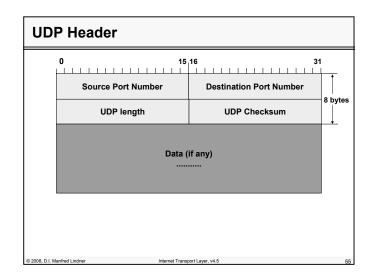

### **UDP Usage**

### UDP is used

- where the overhead of a connection oriented service is undesirable
  - · e.g. for short DNS request/reply
- where the implementation has to be small
   e.g. BootP, TFTP, DHCP, SNMP
- where retransmission of lost segments makes no sense  $% \left( {{{\mathbf{x}}_{i}}} \right)$ 
  - Voice over IP
  - note: digitized voice is critical concerning delay but not against loss
    - Voice is encapsulated in RTP (Real-time Transport Protocol)
    - RTP is encapsulated in UDP
    - RTCP (RTP Control Protocol) propagates control information in the opposite direction
    - RTCP is encapsulated in UDP

2008, D.I. Manfred Lindner

### L11 - Internet Transport Layer (TCP, UDP)

### **UDP Header Entries**

### Source and Destination Port

- Port number for addressing the process (application)
- Well known port numbers defined in RFC1700

### • UDP Length

© 2008, D.I. Manfred Lindner

- Length of the UDP datagram (Header plus Data)

### • UDP Checksum

 Checksum includes pseudo IP header (IP src/dst addr., protocol field), UDP header and user data. One's complement of the sum of all one's complements

### L11 - Internet Transport Layer (TCP, UDP)

### VoIP Clients, Gateways, Servers Clients User-interface To call or end a call Analogue – digital encoding of speech IP-data packetizing - Decode from digital into analogue speech 2 Types:

- Clients: software-clients or IP-telephones
- Virtual clients: provided by gateway, interface for conventional telecommunication equipment like telephones, fax etc.

VoIP-Gateway

- Bridge between conventional and IP telephony
- Allows both users to communicate with their different equipment

### Server

- IP-telephony management and control
- Management of connection requirements of connection and exchange processes like
- Call forwarding, conference calls, user administration of their profiles and access rights, call tracking, billing, answering machine, voice-mail function

Internet Transport Layer, v4.5

© 2008, D.I. Manfred Lindner

### Tasks of a VoIP Gateway Task 1: matching telephone number - IP-address whenever you call from a conventional phone over the VoIP gateway, the server has to convert the wanted phone number into an IP-address of the remote gateway of the call receiver with a database lookup. - peripheral database => directly implemented in gateway performance advantages in speed - central database on a server where all gateways have access bigger latency but no database replication is needed Task 2: Connection establishment - Gateway is contacting the remote-gateway and exchanging security, encoding, capacity and setup information until connection is established © 2008, D.I. Manfred Lindner Internet Transport Layer, v4.

© 2008, D.I. Manfred Lindner

© 2008, D.I. Manfred Lindner

Page 11 - 29

### Tasks of a VoIP Gateway

### • Task 3: digitalization and compression

- Analogue speech signals have to be digitized before compression.
- Common technique: 64K Pulse Code Modulation (PCM)
- ISDN channels can be easily connected because they are already 64K PCM encoded and can be bridged. Compression into one of several codec-formats is done by the Digital Signal Processor (DSP)

### • Task 4: Packetizing and packet delivery

- Wrap data into IP packets and dispatch them via UDP and TCP
- Advantage of UDP: no error detection and recovery => faster, more efficient, retransmission of speech wouldn't make sense => delay

Internet Transport Laver v4 5

### 2008, D.I. Manfred Lindner

### Current Problems of Internet Telephony

### • Standards

- interoperability between Internet telephony products and PSTN-based systems and services
- Users have to have the same kind of software

### • Quality

- Voice performance is measured by delay
- Calls on PSTN have about 50-70 msec delay
- On internet there is an increased latency of ~ 500 msec
- But human latency tolerance is only ~ 250 msec
- Today's products exceed it so it sound like calls routed over a satellite circuit

2008, D.I. Manfred Lindner

Internet Transport Layer, v4.5

Datenkommunikation 384.081 - SS 2008

### L11 - Internet Transport Layer (TCP, UDP)

### Current Problems of Internet Telephony 2

### Capacity

- Packet loss occur because of network congestion due to
  - · bandwidth limitation
  - traffic overload  $\rightarrow$  transmission delays and packet discards
  - Error performance → inadequate network access links cause bandwidth congestion (very bad on transcontinental links)
  - applications repair lost packets with silence → speech clipping effects → Even the loss of an individual packet has an impact on speech due to the large packet size.

### Social issues

© 2008 D L Manfred Lindner

 Traditional telephone providers (often monopolies) are against Internet-based providers because they have an "unfair" advantage in offering cut-rate long distance phone service.

1

Internet Transport Laver v4.5

· Conclusion: It is very political!

### Solution to Current Problems

### • Standards

- ITU H.323 recommendation for VoN applications
- Improved voice compression codecs
- T.120 for data conferencing
- RTP (Real Time Protocol)
- RTCP (Real Time Control Protocol)
- IP QoS (IntSrv with Resource Reservation Protocol or DiffSrv with DSCP)
- SIP (Session Initiation Protocol)

### • Quality improvements

- protocol improvements (IP QoS) and codec improvements
- bigger routers (gigabit routers)
- new network architectures and better links

© 2008, D.I. Manfred Lindner

© 2008, D.I. Manfred Lindner

Internet Transport Layer, v4.5

2

### Solution to Current Problems

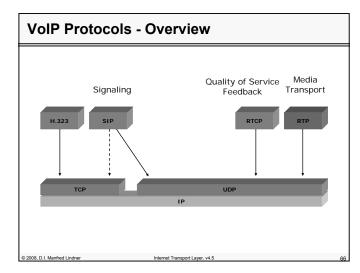

### • Capacity

- average hop number of trans-Atlantic call is 20 to 30
- delay increase with every router hop
  - increase routing speed
  - more routers
  - bigger routers (gigabit router)
  - handle at least 10 times more traffic than conventional router
  - per-packet cost of gigabit routing is 3-4 times less than traditional routing

### Social issues

- encourage new technology
- trend of technology development
  - more than 100 well known companies are involved

2008, D.I. Manfred Lindner Internet Transport Layer, v4.5

© 2008, D.I. Manfred Lindner

### L11 - Internet Transport Layer (TCP, UDP)

### Agenda

- TCP Fundamentals
- UDP
- TCP Performance
  - Slow Start and Congestion Avoidance
  - Fast Retransmit and Fast Recovery
  - TCP Window Scale Option and SACK Options
- RFC Collection

### How to Improve TCP Performance?

### • Problem:

© 2008 D I Manfred Lindner

 in case of packet loss sender can use the window given by the receiver but when window becomes closed the sender must wait until <u>retransmission timer</u> times out

Internet Transport Laver v4 5

- that means during that time sender cannot use offered bandwidth of the network
- -> TCP performance degradation

### • Assumption:

© 2008, D.I. Manfred Lindner

 packet loss in today's networks are mainly caused by congestion but not by bit errors on physical lines

Internet Transport Layer, v4

- · optical transmission
- digital transmission

© 2008, D.I. Manfred Lindner

Page 11 - 33

### Congestion

- Problem of bottle-neck inside of a network
  - Some intermediate router must queue packets
  - Queue overflow -> retransmission -> more overflow !
  - Can't be solved by traditional receiver-imposed flow control (using the window field)
- Ideal case: rate at which new segments are injected into the network = acknowledgment-rate of the other end
  - Requires a sensitive algorithm to catch the equilibrium point between high data throughput and packet dropping due to queue overflow:
     Van Jacobson's Slow Start and Congestion Avoidance
    - ed lineer

### **Slow Start**

© 2008, D.I. Manfred Lindner

2008 D I Manfred Lindner

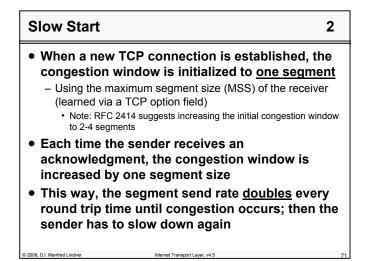

- <u>Duplicate Ack</u> can be used for catching this equilibrium
  - That is the base for Slow Start and Congestion Avoidance

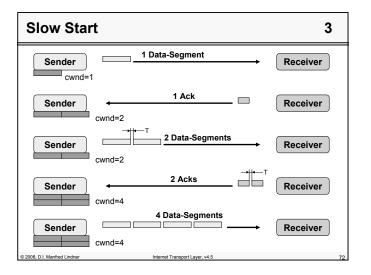

1

- Slow start (and congestion avoidance) is mandatory for today's TCP implementations !
- Slow start requires TCP to maintain an additional window: the <u>"congestion window"</u> (cwnd)
  - <u>Rule:</u> The sender may transmit up to the minimum of the congestion window and the advertised window

Internet Transport Layer, v4

### L11 - Internet Transport Layer (TCP, UDP)

© 2008, D.I. Manfred Lindner

Page 11 - 35

© 2008, D.I. Manfred Lindner

### Congestion

2008 D L Manfred Lindner

- Slow start encounters congestion, when
  - routers connect pipes with different bandwidth
  - routers combine several input pipes and the bandwidth of the output pipe is less than the sum of the input bandwidths
  - and hence TCP segment(s) is (are) dropped by a router
- Congestion can be detected by the sender through <u>timeouts</u> or <u>duplicate</u> acknowledgements
- Slow start reduces its sending rate with the help of another algorithm, called <u>"Congestion</u> Avoidance"

Internet Transport Layer, v4.5

### **Congestion Avoidance**

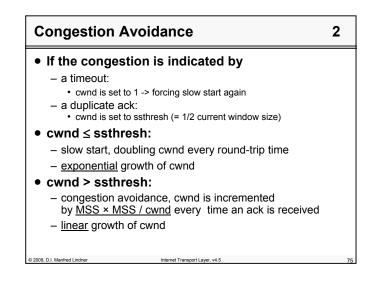

- Slow start with congestion avoidance is a sender-imposed flow control
  - Congestion Avoidance requires TCP to maintain a variable called <u>"slow start threshold"</u> (ssthresh)
  - Initially, ssthresh is set to TCPs maximum possible MSS (i.e. 65,535 octets)
- On detection of congestion, ssthresh is set to half the current window size
  - here, window size means: minimum of advertised window and congestion window (but at least 2 segments)
  - Note: ssthresh marks a safe window size because congestion occurred at a window size of 2 x ssthresh

L11 - Internet Transport Layer (TCP, UDP)

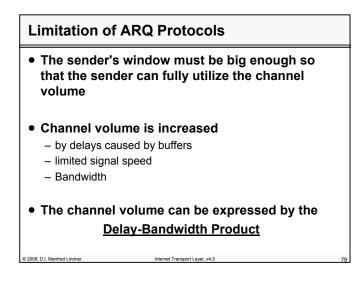

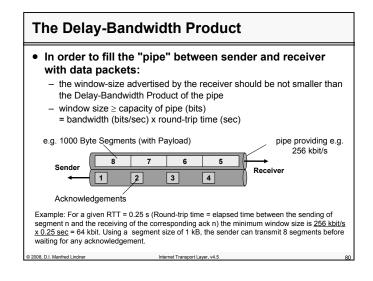

### **Limitation of ARQ Protocols**

© 2008, D.I. Manfred Lindner

- The performance of any connection-oriented protocol with error-recovery (ARQ) is limited by bandwidth and delay by nature!
  - Optimum can be achieved by using Continous RQ with sliding window technique where the window is large enough to avoid stopping of sending
  - Large enough means to cover the time of the serialization and propagation delays
  - Note: senders and receivers window size maybe also be limited because of memory constraints

### **Receiver Requirements**

- Initially, TCP could detect packet loss only by expiration of the retransmission timer
  - receiver stops sending Acks until the sender retransmits all missing segments
  - causes long delays

2008 D L Manfred Lindner

2008, D.I. Manfred Lindner

 Fast Retransmit requires a receiver to send an immediate <u>duplicate</u> acknowledgement in order to notify the sender which segments are (still) expected by the receiver

Internet Transport Laver v4 5

### Sender Aspects and Fast Retransmit

### • When should retransmission occur?

- Note: the receiver will also send duplicate acknowledgements when segments are arriving in the wrong order
- Typically reordering problems cause one or two duplicate acks on the average
- Therefore, TCP sender awaits two duplicate acknowledgements and starts retransmission after the third duplicate acknowledgement

Internet Transport Layer

- that mechanism is called "Fast Retransmit"

### L11 - Internet Transport Layer (TCP, UDP)

1

### Fast Recovery

© 2008 D L Manfred Lindner

• "Fast Retransmit" automatically commences "Fast Recovery" in order to rapidly repair single packet loss

### • "Fast Recovery" mechanism:

- ssthresh is set to half the current window size
- cwnd is set to ssthresh plus 3 times the segment size
  - Remember: Fast Retransmit waits for 3 duplicate acks; from this can be concluded that the receiver must have received 3 segments already

Internet Transport Laver v4 5

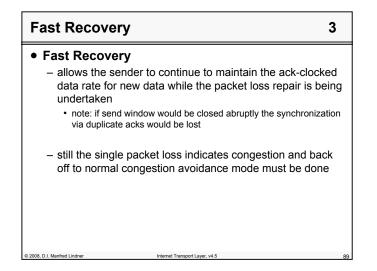

# Fast Recovery 2 • "Fast Recovery" mechanism cont. - congestion avoidance, but not slow start is performed • Remember: The receiver can only generate a duplicate ack when another segment is received. That is: there are still segments flowing through the network! Slow start would reduce this flow abruptly! • For each additional duplicate ack, the sender increases cwnd by 1 segment size • Upon receiving an ack that acknowledges new data • cwnd is set to ssthresh • sender resumes normal congestion avoidance mode

### **TCP Options**

### Window-scale option

- a maximum segment size of 65,535 octets is inefficient for high delay-bandwidth paths
- the window-scale option allows the advertised window size to be left-shifted (i.e. multiplication by 2)
- enables a maximum window size of 2^30 octets !
- negotiated during connection establishment

### SACK (Selective Acknowledgement)

 if the SACK-permitted option is set during connection establishment, the receiver may selectively acknowledge already received data even if there is a gap in the TCP stream (Ack-based synchronization maintained)

Internet Transport Layer, v4.5

### Agenda

2008 D I Manfred Lindner

• TCP Fundamentals

• UDP

2008, D.I. Manfred Lindner

- TCP Performance
  - Slow Start and Congestion Avoidance
  - Fast Retransmit and Fast Recovery
  - TCP Window Scale Option and SACK Options
- RFC Collection

L11 - Internet Transport Layer (TCP, UDP)

### RFCs

- 0761 TCP
- 0813 Window and Acknowledgement Strategy in TCP
- 0879 The TCP Maximum Segment Size
- 0896 Congestion Control in TCP/IP Internetworks
- 1072 TCP Extension for Long-Delay Paths
- 1106 TCP Big Window and Nak Options
- 1110 Problems with Big Window
- 1122 Requirements for Internet Hosts -- Com. Layer
- 1185 TCP Extension for High-Speed Paths
- 1323 High Performance Extensions (Window Scale)

Internet Transport Laver v4 5

### **RFCs**
